

Material objects come down to forms in which waves of energy vibrate more rapidly than they do in space.

Matter is a more active form of space and space a less active form of matter. In reality there is no separation between the two; one evolves into the other.

We cannot see these rays of space though we have devised instruments to record them. But when these rays vibrate rapidly enough, yet not too rapidly, we see a line. And when there are many lines emanating from various points of origin which are yet contiguous, we become aware of an object.

Matter is as immaterial as space; they are both one and the same. Space is as material as matter, neither more nor less but identical.
